RUBRICS for PROJECT (IT305W – Advanced Web Applications)

Group Members:

1.
2.
3.
4.
5.

Instructions:

1. Group yourselves into 5 members (max) per team.
2. Create a full website of your own (any kind of website system) using the programming languages and frameworks we discussed. (You can use your project in SAD as long as it has the criteria needed for the project).
3. Presented below is the rubrics for the project.

RUBRICS:

Criteria	Excellent	Good	Fair	Poor	Points
1. JSON Implementation (Required)	JSON is properly implemented as the main data format; students demonstrate creating, reading, parsing, displaying, and/or manipulating JSON data effectively.	JSON is properly used with minor implementation issues.	JSON is present but has limited functionality or weak integration.	JSON is missing or improperly implemented.	**20**
2. AJAX Implementation (Required)	AJAX is effectively used to communicate with the server and dynamically retrieve/send data without unnecessary page reloads.	AJAX works properly but has minor issues or limited usage.	AJAX is implemented but only minimally or with noticeable errors.	AJAX is missing or does not function.	**20**
3. PHP Programming &	PHP is extensively used for server-side	PHP is properly used for most server-side	PHP is used but functionality is basic or	PHP is minimally used or mostly	**20**

Server-Side Processing	processing, data handling, validation, business logic, sessions, and/or database operations. Code is organized and functional.	requirements with minor issues.	contains several issues.	replaced by static content.	
4. HTML & CSS Implementation	Well-structured HTML and well-organized CSS create a responsive, consistent, and functional interface.	Good HTML/CSS implementation with minor design or structural issues.	Basic HTML/CSS with limited responsiveness or consistency.	Poor structure, styling, or significant layout problems.	**10**
5. jQuery / Additional Web Technology (Optional Bonus)	jQuery is meaningfully integrated to improve DOM manipulation, events, AJAX, validation, effects, or other functionality.	jQuery is used appropriately but only for a few features.	jQuery is present but provides little functional value.	Not implemented.	**+5 Bonus**
6. Database / Data Management	Data is properly stored, retrieved, updated, and managed when appropriate; database interaction is secure and logically designed.	Database/data management works with minor issues.	Basic database functionality is present but limited.	Data management is poorly implemented or non-functional.	**10**
7. System Functionality & Integration	All major features work together seamlessly; JSON, AJAX, PHP,	Most features work and are properly	Several features work but	Major functions are	**10**

	HTML/CSS, and data management are properly integrated into one functional system.	integrated with minor issues.	integration is inconsistent.	incomplete or disconnected.	
8. Creativity, User Experience & Interface Design	System is highly creative, organized, intuitive, visually appealing, responsive, and appropriate for its intended users.	Creative and user-friendly with good overall design.	Functional but has limited creativity or usability.	Difficult to use, poorly organized, or lacks originality.	**5**
9. Security, Validation & Error Handling	Includes appropriate input validation, error handling, prevention of invalid requests, secure data handling, and protection against common web vulnerabilities.	Good validation and error handling with minor gaps.	Basic validation/error handling is present.	Little or no validation or error handling.	**5**
TOTAL					**100**
